

# Interpretable Distribution Features with Maximum Testing Power

Wittawat Jitkrittum, Zoltán Szabó, Kacper Chwialkowski, Arthur Gretton

Gatsby Computational Neuroscience Unit, University College London

## Summary

- **Have:** Two collections drawn from two unknown distributions.
- **Goal:** Learn distinguishing features indicating how they differ.
- **How:** Maximize a lower bound on test power for a two-sample test using these features.
- **Our methods are both:**
  1. Understandable spatial and frequency feature extractors.
  2. Linear-time, nonparametric, consistent, two-sample tests. **(Power matches the quadratic-time MMD test).**
- **Applications:** 1. Differentiate positive/negative emotions. 2. Distinguish articles from different categories.

## ME and SCF Tests

- Observe  $X := \{\mathbf{x}_i\}_{i=1}^n \sim P$  and  $Y := \{\mathbf{y}_i\}_{i=1}^n \sim Q$  in  $\mathbb{R}^d$ .
- Test  $H_0 : P = Q$  v.s.  $H_1 : P \neq Q$ . Calculate a statistic  $\hat{\lambda}_n$ , and reject  $H_0$  if  $\hat{\lambda}_n > T_\alpha = (1 - \alpha)$ -quantile of the null distribution.

### Mean Embedding (ME) Test:

$$\text{Test statistic: } \hat{\lambda}_n := n\mathbf{w}_n^\top (\mathbf{S}_n + \gamma_n \mathbf{I})^{-1} \mathbf{w}_n,$$

- $J$  spatial features (test locations):  $\mathcal{V} = \{\mathbf{v}_1, \dots, \mathbf{v}_J\}$ .
- Regularizer  $\gamma_n$ . Gaussian kernel  $k_\sigma$ .
- Witness function:  $\text{witness}(\mathbf{v}) := \mathbb{E}_x[k_\sigma(\mathbf{x}, \mathbf{v})] - \mathbb{E}_y[k_\sigma(\mathbf{y}, \mathbf{v})]$ .
- $\mathbf{w}_n := (\text{witness}(\mathbf{v}_1), \dots, \text{witness}(\mathbf{v}_J))^\top \in \mathbb{R}^J$ .
- $(\mathbf{S}_n)_{ij} = \widehat{\text{cov}}_x[k(\mathbf{x}, \mathbf{v}_i), k(\mathbf{x}, \mathbf{v}_j)] + \widehat{\text{cov}}_y[k(\mathbf{y}, \mathbf{v}_i), k(\mathbf{y}, \mathbf{v}_j)]$ .
- Under  $H_0$ ,  $\hat{\lambda}_n$  asymptotically follows  $\chi^2(J)$ .

### Smooth Characteristic Function (SCF) Test:

- Difference of smoothed (by  $l$ ) characteristic functions.

## Test Power Lower Bound

**Proposition.** The power  $\mathbb{P}_{H_1}(\hat{\lambda}_n \geq T_\alpha)$  of the ME test is at least

$$L(\lambda_n) = 1 - 2e^{-\xi_1(\lambda_n - T_\alpha)^2/n} - 2e^{-\frac{[\gamma_n(\lambda_n - T_\alpha)(n-1) - \xi_2 n]^2}{\xi_3 n(2n-1)^2}} - 2e^{-\frac{[(\lambda_n - T_\alpha)/3 - \bar{c}_3 \gamma_n]^2 \gamma_n^2}{\xi_4}}$$

For large  $n$ ,  $L(\lambda_n)$  is increasing in  $\lambda_n$ .

- $\lambda_n$  is the population counterpart of  $\hat{\lambda}_n$ . Constants:  $\bar{c}_3, \xi_1, \dots, \xi_4 > 0$ .
- **Proposal:** Optimize  $\mathcal{V}, \sigma = \arg \max_{\mathcal{V}, \sigma} L(\lambda_n) = \arg \max_{\mathcal{V}, \sigma} \lambda_n$ .
- **Key:** Parameters chosen to maximize the test power lower bound.
- Use a separate training set to estimate  $\lambda_n$ .

## Informative Features

- Contour plot of  $\hat{\lambda}_n$  as a function of  $\mathbf{v}_2$  when  $J = 2$ .  $\mathbf{v}_1$  fixed at  $\blacktriangle$ .
- 
- $P: \mathcal{N}([0, 0], \mathbf{I})$  vs.  $Q: \mathcal{N}([1, 0], \mathbf{I})$ .
  - $\hat{\lambda}_n$  is high in the regions that reveal the difference.
  - Nonconvexity indicates many informative ways to detect the differences.

## Test Power vs. Sample Size

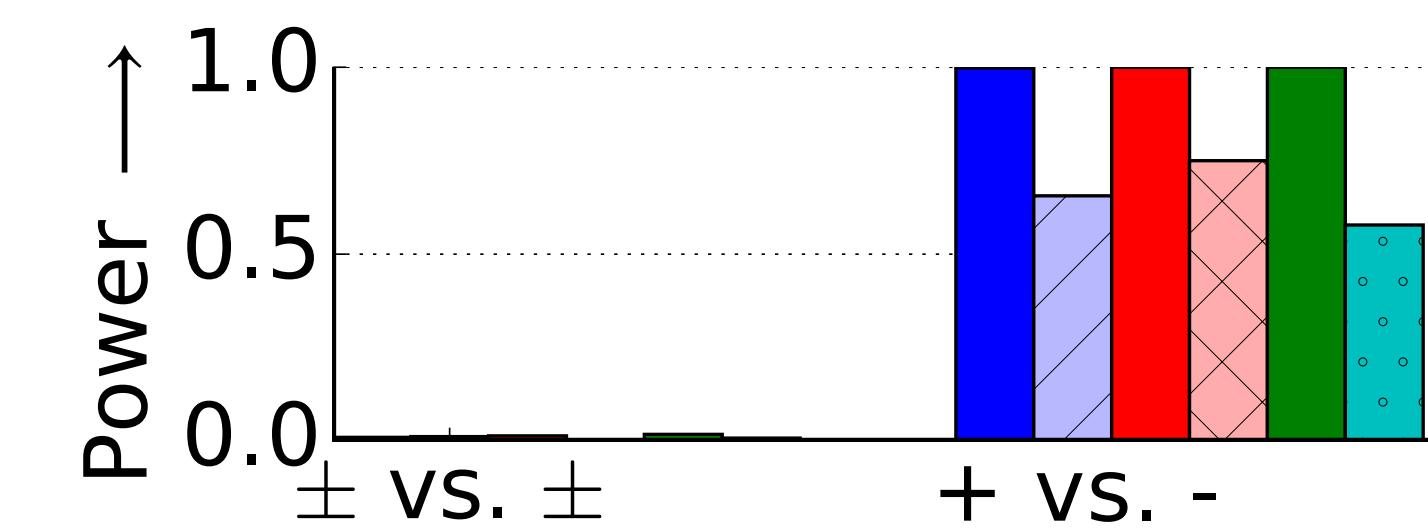

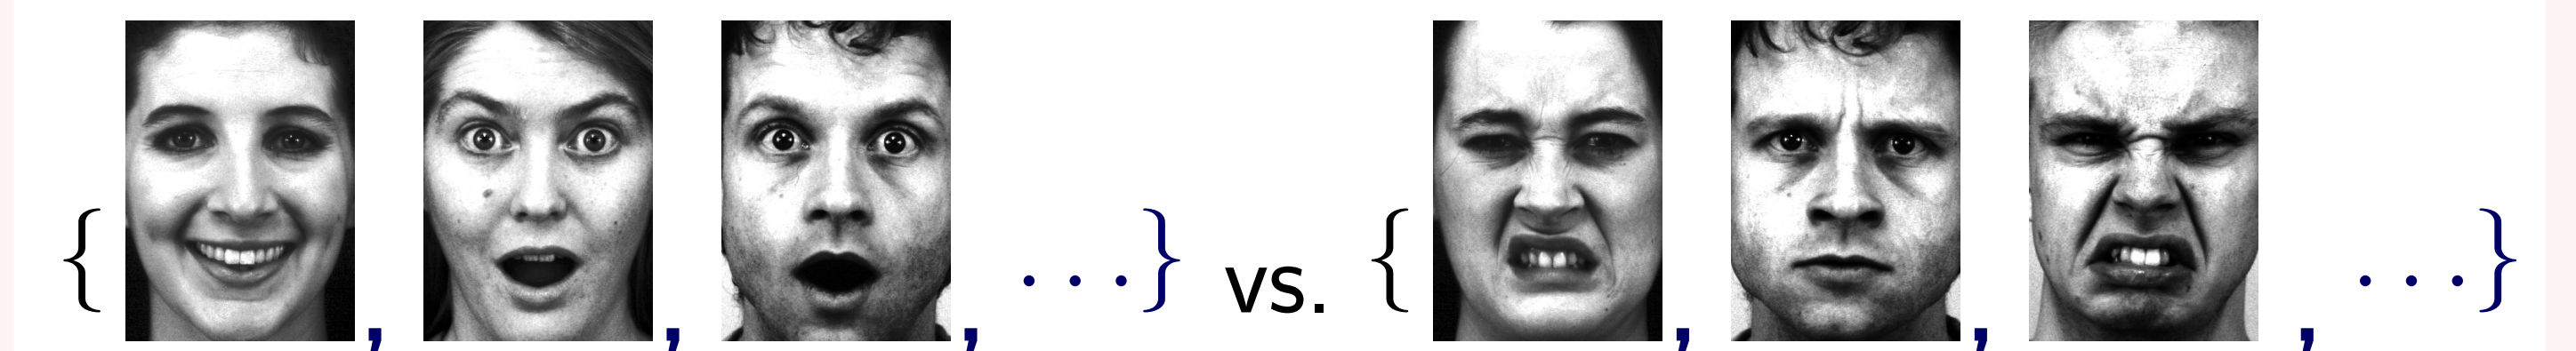

- **ME-full, SCF-full** = Proposed methods. Full optimization.  $J = 5$ .
- **ME-grid, SCF-grid** = Random  $\mathcal{V}$ . Grid search for  $\sigma$ .
- **MMD-quad, MMD-lin** = Quadratic and linear-time MMD tests.

- **GVD:** Best performance by **ME-full**. Spatial differences.
- **Blobs:** Best performance by **SCF-full**. Frequency differences.

## Distinguishing Pos. & Neg. Emotions

- **Task:** distinguish positive and negative facial expressions.
- $d = 48 \times 34 = 1632$  pixels. Use raw pixels. One feature ( $J = 1$ ).

Learned feature

- ME-full, SCF-full achieves high test power.
- ME-full learned an informative feature.

## Distinguishing NIPS Articles

- **Task:** distinguish two categories of NIPS papers (1988–2015).
- Stemmed  $d = 2000$  nouns. TF-IDF representation.  $J = 1$ .

- ME-full: high powers comparable to MMD-quad; but faster.
- Learned documents by ME-full show distinguishing keywords.
- **Bayes-Deep:** infer, Bayes, Monte Carlo, adaptor, motif, haplotype, ECG
- **Bayes-Neuro:** spike, Markov, cortex, dropout, recurrent, iii, Gibbs, basin
- **Learn-Neuro:** policy, interconnect, hardware, decay, histology, EDG, period
